# **Tribojet**

The goal of Tribojet is to deploy a propulsion system which works in Earth atmospheric conditions, as well as interstellar space applications. Current development fuels are made from liquid CO<sub>2</sub> and water.

## **Turbine**

One example of our development projects was a metal 3D printed counter rotating turbine and turbopump.

## Closed Loop CO2 Turbine

This is one of our testing platforms to develop a closed loop CO2 turbine and plasma generator. There are many concepts at play, including generating plasma, or just electricity for Earth atmospheric applications, like drones or aircraft.

# **TriboJet Module Legend**

General flowchart of the Tribojet turbine and modules which are connected by magnetic drive.  
Heat required: greater than 304.13K, 31C, or 88F.
